

My journey into AI/ML began with curiosity about how intelligent systems make decisions and improve user experiences. As a student passionate about technology, I started by learning programming fundamentals in Java and Python, which gradually led me toward machine learning concepts such as data preprocessing, supervised learning, and model evaluation.

To strengthen my understanding, I explored beginner-level projects using Python libraries like NumPy, Pandas, and Scikit-learn. I worked on small projects such as student performance prediction, spam message classification, and basic sentiment analysis. These projects helped me understand how data is collected, cleaned, trained, and transformed into useful predictions. Alongside technical learning, I also practiced problem-solving and logical thinking through coding exercises and online challenges.

Apart from academics, I actively explore UI/UX design and software development concepts, which has helped me think about AI not only from a technical perspective but also from a user-centered perspective. I enjoy understanding how technology can solve real-world problems efficiently and at scale.

While I have gained foundational knowledge in machine learning, I believe there are still important gaps in my understanding, especially in deep learning, neural networks, optimization techniques, model deployment, and large-scale ML systems. I also want to improve my understanding of the mathematics behind machine learning algorithms and learn how industry experts approach practical ML challenges. Amazon ML Summer School provides exactly the kind of structured learning, mentorship, and exposure that I am looking for.

What makes me a strong fit for this program is my willingness to learn consistently and apply concepts through practice. I may still be at an early stage in my AI/ML journey, but I approach every new topic with curiosity, discipline, and determination. I enjoy learning by building, experimenting, and improving step by step. I am especially excited about learning from researchers and engineers who are working on real-world AI systems.

Through MLSS, I hope to gain deeper technical knowledge, interact with like-minded learners, and build a strong foundation for contributing to impactful AI solutions in the future. I believe this opportunity will help me bridge the gap between theoretical learning and practical implementation while motivating me to pursue advanced work in AI/ML.
